

PUBLIC CLOUD SLA UPTIME THRESHOLDS AND SERVICE CREDIT PERCENTAGES (FACTS TABLE)

AWS EC2 — region level (commitment: 99.99% Monthly Uptime Percentage)

MONTHLY UPTIME PERCENTAGE	SERVICE CREDIT
< 99.99% and $\geq$ 99.0%	10%
< 99.0% and $\geq$ 95.0%	30%
< 95.0%	100%

AWS EC2 — instance level: same credit tiers against a 99.5% commitment. AWS also does not charge for a single EC2 instance that is unavailable for more than six minutes of a clock hour.

AWS S3 / RDS / Lambda / ECS-Fargate (commitment: 99.9%)

MONTHLY UPTIME PERCENTAGE	SERVICE CREDIT
< 99.9% and $\geq$ 99.0%	10%
< 99.0% and $\geq$ 95.0%	25%
< 95.0%	100%

Note the 30% vs 25% middle tier. This is a real, citable inconsistency between services of the same vendor, and is the source pattern behind the synthetic service-credit conflict (SYN-009 / SYN-010).

AWS EKS control plane

Commitment 99.95% (standard) / 99.99% (provisioned); tiered credits of the same shape.

Azure — Virtual Machines (commitment: 99.99% for two or more instances across availability zones; 99.9% single instance with premium storage)

MONTHLY UPTIME PERCENTAGE	SERVICE CREDIT
< 99.99%	10%
< 99.0%	25%
< 95.0%	100%

Google Cloud — Compute Engine (commitment: 99.99% for instances in multiple zones)

MONTHLY UPTIME PERCENTAGE	SERVICE CREDIT
$\geq 99.0\%$ and $< 99.99\%$	10%
$\geq 95.0\%$ and $< 99.0\%$	25%
$< 95.0\%$	100%

Shape of the rule (what the Catala module encodes)

`uptime (decimal) × monthly_fee (money) → credit_percentage (decimal), credit (money)`, a descending chain of conditional definitions with a 100%-of-monthly-fee ceiling and a 30-day claim window. Identical structure across every vendor; only the numbers move.
